## FACILITY OWNERS, CONSTRUCTION MANAGERS, & CONTRACTORS

Facility owners managing construction projects face the difficult task of balancing cost-effectiveness with employee and worker safety. WPS LLC helps, whether the work is handled internally or by a contractor or manager. Our proven safety management services have been utilized by facility owners in a range of industries, including pharmaceuticals, oil and gas, refineries, power plants, hospitals, manufacturing, airports, hotels, and more.

### YOUR CHALLENGES

Facility owners often face a variety of challenges during construction projects. In-house EH&S staff may have expertise in general industry safety but lack construction knowledge. Hiring construction safety specialists may not be possible due to headcount restrictions. Companies with in-house maintenance staff may not have enough support during high-demand periods

Conflicts can arise between owners and contractors due to differing safety rules and cultures, making it challenging to enforce the owner's safety program without dictating work methods. Inconsistent safety programs from facility to facility and different safety rules followed by contractors working together can create confusion. Prime contractors may prioritize expertise over safety records when selecting specialty contractors.

Construction sites pose hazards to general facility employees who are typically focused on daily operations rather than construction safety. The risk of accidents and related litigation is high, as owners are often viewed as having deep pockets.

### OUR SOLUTION

#### Expertise Working with Facility Owners

Construction projects often occur in areas where regular facility employees are performing their daily tasks, increasing the potential dangers posed by the construction site. Audit, inspection and gap analysis of the multiple health and safety plans will provide the proper mitigation and best practices to protect all involved. Decreasing the risk of accidents and associated legal consequences.

#### Efficient Subcontractor Oversight

Beginning with review of the scope of work being performed the effective adjustment of sub-contractor requirements, orientation development and presentation, as well as, daily safe work permit tracking and trending can outline potential challenges and corrective action alternatives quickly and efficiently.
